

WISHCODE

Enterprise Token Governance Blueprint

Executive Summary

Enterprise AI delivers value only when computing resources are governed with the same discipline as financial, operational, and security assets. Wishcode provides a governance framework for measuring, allocating, and controlling AI compute while maintaining predictable costs and operational continuity.

1. Measure Before You Budget

Establish baseline metrics for context size, system instruction overhead, average response length, model selection, daily request volume, and departmental usage. Budget from measured reality—not assumptions.

2. Budget by Business Function

Different departments require different compute allocations based on workload and business value.

Department	Governance Policy
Customer Support	High-volume, cost-efficient AI models
Engineering	Flexible reasoning budgets
Executive Strategy	Premium reasoning allocation
Background Automation	Dedicated monthly compute pools

3. Govern Compute

Implement usage dashboards, soft budget notifications, hard consumption limits, intelligent model routing, prompt caching, department-level token policies, token allocation by role and enterprise-wide visibility.

4. Capacity Planning

Daily Active Users × Average Requests × Average Tokens = Daily Compute Consumption

Daily Compute Consumption × Working Days = Baseline Monthly Capacity

Baseline Monthly Capacity + Operational Buffer = Governed Monthly Token Budget

Enterprise Benefits

- Predictable costs
- Reduced compute overruns
- Role-based resource allocation
- Better model utilization
- Sustainable enterprise AI adoption

Wishcode Principle

You can't govern what you can't measure.

Token governance is not about restricting AI. It is about creating visibility, accountability, predictable costs, uninterrupted operations, and sustainable enterprise intelligence.
